# 7sisters Ultradefensive 10 stocks - Introduction

"7sisters Ultradefensive 10 stocks" is a defensive equity portfolio based on an algorithm developed on portfolio123.com. It is primarily oriented towards capital preservation, in particular during economic downturns. Given the potential of a recession and stock market declines over the next 12-18 month (as of March 2016), it is an interesting period to test this trading system.

Some of the model goals are:

- in-line performance during times of economic expansion;
- outperformance during recessions and subsequent recoveries;
- relatively low drawdowns;
- high liquidity (minimum \$ 10 MM);
- moderate trading requirement (<900% turnover per annum).

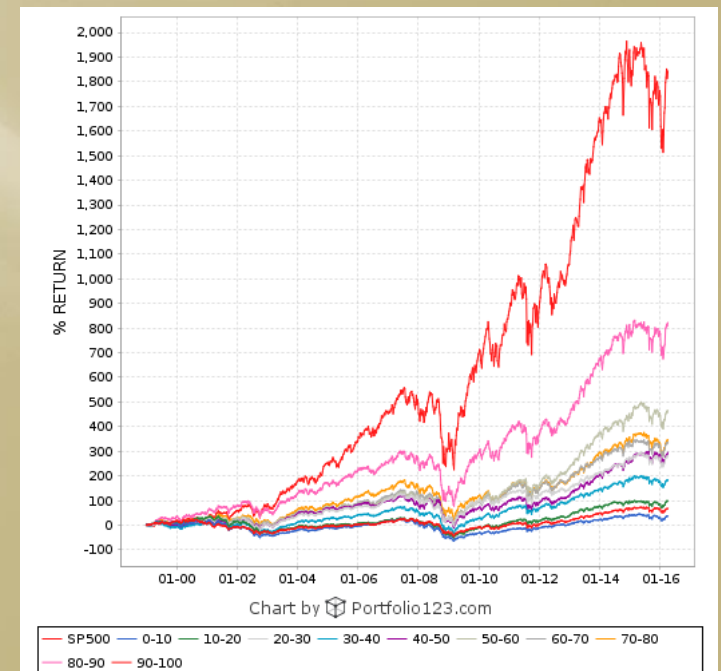

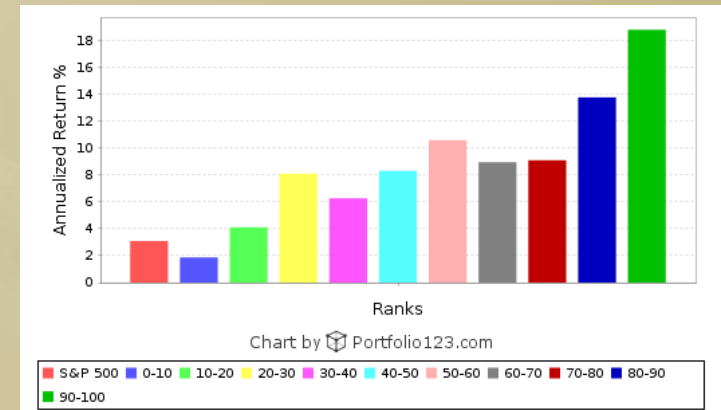

The stock picking is based on a ranking system and several buy rule filters. The stock universe is limited to the defensive S&P500 sectors healthcare, staples, telecom & utilities, while the IEF (7-10 year bond ETF) serves as hedge instrument.

With high liquidity of the underlying universe this model is suited as defensive strategy for both individual investors and small mutual funds and allows conservative capital allocation without considerable slippage.

# 7sisters Ultradefensive 10 stocks – Model setup

"7sisters Ultradefensive 10 stocks" has the following setup:

- a universe limited to defensive sectors (healthcare, staples, telecom & utilities) within the S&P500; corresponds to approximately 130 stocks;
- a 10 factor ranking system (based on weekly rebalance shown on the right); the uppermost quintile is considered in the buy rule Rank > 79;
- weekly rebalance;
- variable slippage;
- 6 buy rules;
- 2 sell rules & mergers not allowed;
- 2 rules triggering hedge entry and exit based on 2 custom series; 50% of total assets are invested in IEF during hedge periods.

# 7sisters Ultradefensive 10 stocks – Market timing & hedge

This model uses a market timing which detects weakness of a larger universe of stocks based on two proprietary custom series generated at Portfolio123. This weakness can occur both in uptrending and downtrending markets. It is independent of the benchmarks' performance and thus not curve-fitted to a benchmark moving average.

The hedge is triggered when the weakness is detected. As the hedge is triggered, the model sells 50% of current equities and invests the resulting cash in IEF (7-10 year bond ETF). When the model exits the hedge, the cash from the IEF sale is used to either double the share of existing stock holdings or to buy new ones based on the ranking recommendations.

Over the entire simulation period the hedge was active 53% of the time (see green graph below). 58% of the hedge periods ended with a positive investment in IEF with an average 2.3% return.

# 7sisters Ultradefensive 10 stocks – Rolling test

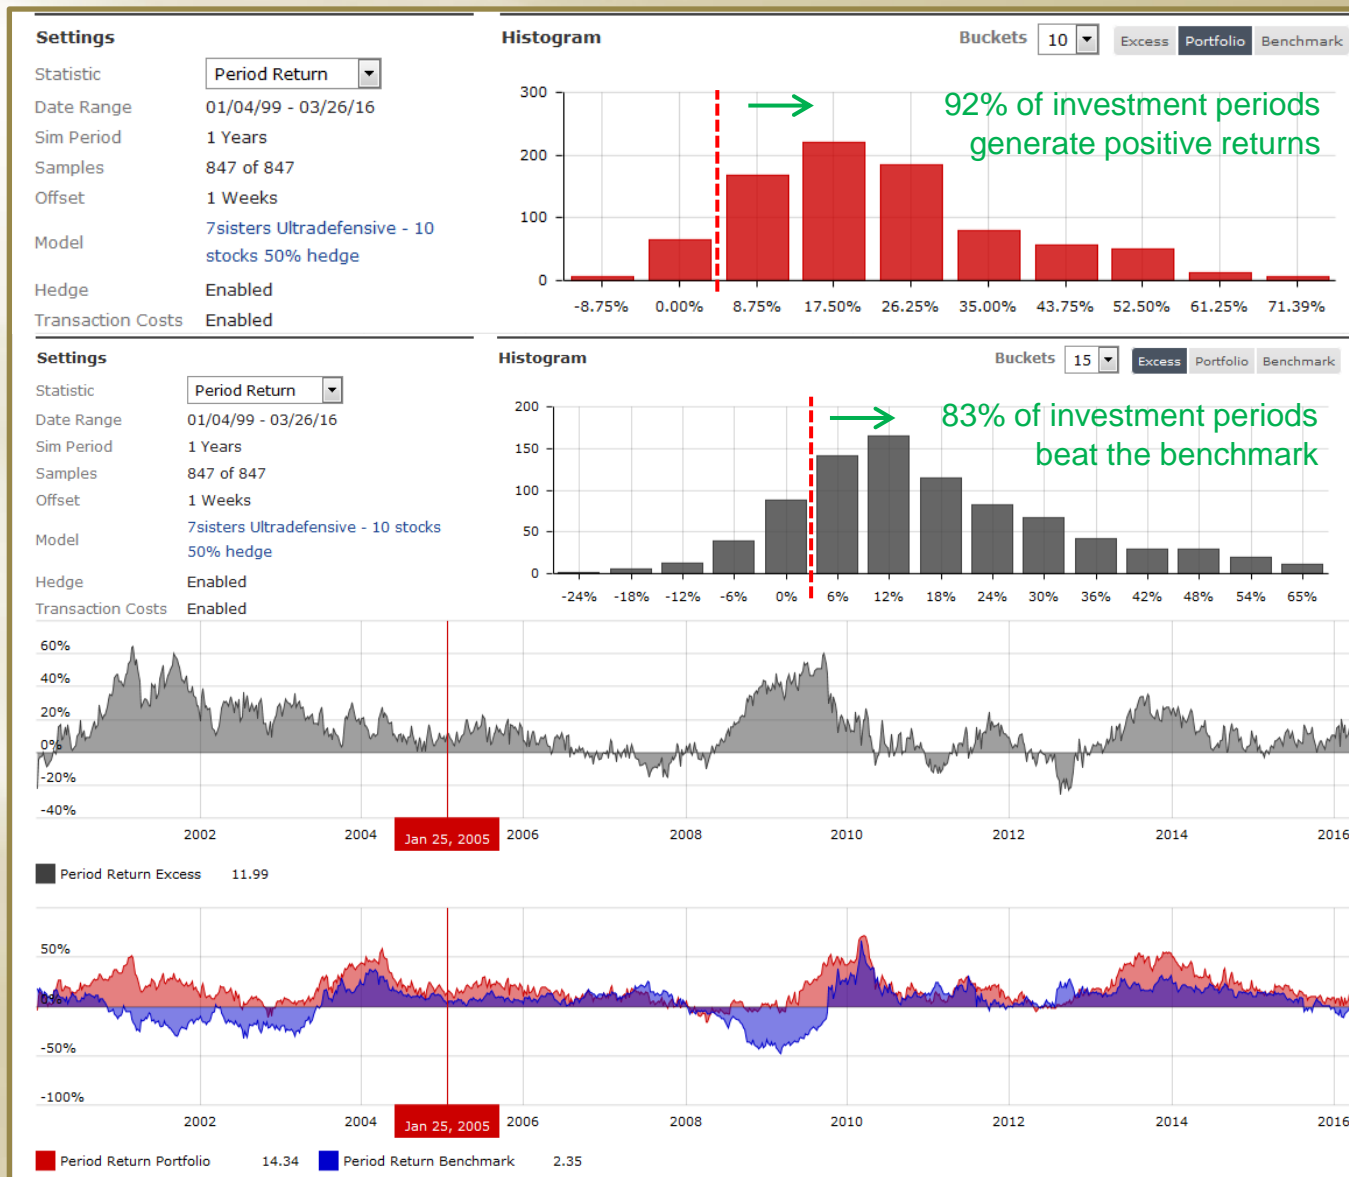

A rolling test is a backtest intended to illustrate the robustness of an algorithm by changing the start date and the investment period of a simulation.

The following page gives a Portfolio123 rolling test summary for 7sisters Ultradefensive 10 stocks model. In this test an industry-standard 1 year investment period was used. The simulation start date of 4 January 1999 was shifted in one week steps, resulting in a total of 847 samples (investment periods).

The two histograms show a split-down of portfolio returns (red bars) and excess returns against the S&P500 benchmark (grey bars). Around 90% of investment periods result in positive returns and over 80% of samples beat the benchmark performance. In order to decrease the risk of negative returns from 10% to >1% in the simulation, an increase in the investment period from 1 year to 3 years is required.

In the graphs underneath the histograms are the results of the 847 individual investment periods plotted along a time series. For example, at the red line with the label “Jan,25 2005” the returns of a 1 year investment starting on 26 Jan 2004 are plotted. For this sample we can see that the excess return was 12% (grey graph), the portfolio return was 14.3% (red graph) and the benchmark return was 2.3% (blue graph).

# 7sisters Ultradefensive 10 stocks – Rolling test

# 7sisters Ultradefensive 10 stocks – Hedging alternatives

All else being equal let's test a selection of alternative hedge options:

**IEF** (default)  
iShares 7-10 year  
Treasury Bond ETF

**TLT**  
iShares 20 plus year  
Treasury Bond ETF

**SH**  
ProShares Short  
S&P500

Go to **cash**. This results in the lowest turnover & MDD, but also in a lower return.

All else being equal let's test the algo's robustness by changing the universe:

**S&P500**  
(default)

**S&P1500**

**PRussell 3000**

**S&P400 (Midcap) &  
S&P600 (Smallcap)**

# 7sisters Ultradefensive 10 stocks – EvenID test

Next to the rolling test and alternative universe test, this last robustness test uses the EvenID function on portfolio123. It splits the universe in half by applying one of the following buy rules: EvenID=0 or EvenID=1. If the algorithm is robust, both halves should produce approximately the same performance.

So all else being equal, here the results of the split S&P500 universe:

# 7sisters Ultradefensive 10 stocks – Model comparison

Lastly, a two page comparison of this model with Keating's Ultra Defensive Portfolio. The latter is the Portfolio123 Smart Alpha model with the highest out-of-sample Sharpe Ratio (2.12) as of 27 March 2016.

Below is a risk statistics summary of the two models:

7SIS - 7sisters Ultradefensive 10 stocks

KEAT - Keating's Ultra Defensive Portfolio

Model - a book combining both portfolios with equal weight

The next page illustrates backtest vs real performance for the last two years.

Risk Measurements - Trailing 3 Year					Risk Measurements - Inception 12/31/99

# 7sisters Ultradefensive 10 stocks – Model comparison

## Keating's Ultra Defensive Portfolio

Out-of-sample performance since launch

Model has 50/50 split of TLT and equities (20 stocks)

TLT is used as constant hedge.

## 7sisters Ultradefensive 10 stocks

Simulated performance prior to launch

Model has 10 stocks and uses intermittent hedge

IEF is used as hedge at 50% of total holdings.

## **Personal disclaimer**

The description of this Smart Alpha model is provided for information purposes only. The information is not intended to be and does not constitute financial advice or an encouragement for investing into this model. This model is based on backtests, and hence there is no guarantee for similar performance in the future. All else being equal, models with better out-of-sample and liquidity statistics are better.

Please note that I am not a financial adviser. If you are unsure about the suitability of investing in this algorithm please seek advice from a registered investment adviser. I don't assume any responsibility for losses incurred through investing into this model.

## **Portfolio123 disclaimers**

**DISCLOSURE:** The content provided in Portfolio123's website and emails is for information purposes only. It does not constitute an offer or an invitation to subscribe for or purchase securities nor an investment recommendation. Portfolio123's Models represent hypothetical or simulated performance, not actual trading. Since the trades have not actually been executed, the results may have under-or-over compensated for the impact of certain market factors, such as liquidity. Remember that past returns are no guarantee of future returns.

**WARNING:** Simulated results may give you false expectations: they are based on hypothetical trades signaled by a model created with full access to knowledge of which stocks did well in the past and which ones did not. Given that we have not (yet) mastered time travel, past performance may not be indicative of future results.
